

# Intelligent Motion Control Platform to Accelerate Mechatronic System R&D

Sherman Li  
Jiangsu JITRI Sioux Technologies Co.,Ltd.

# Agenda

1

Background

2

Concept for Intelligent Motion Control Platform

3

Intelligent Motion Control Platform Architecture and Features

4

Application Example: UPSS Product

5

Introduce Sioux Technologies

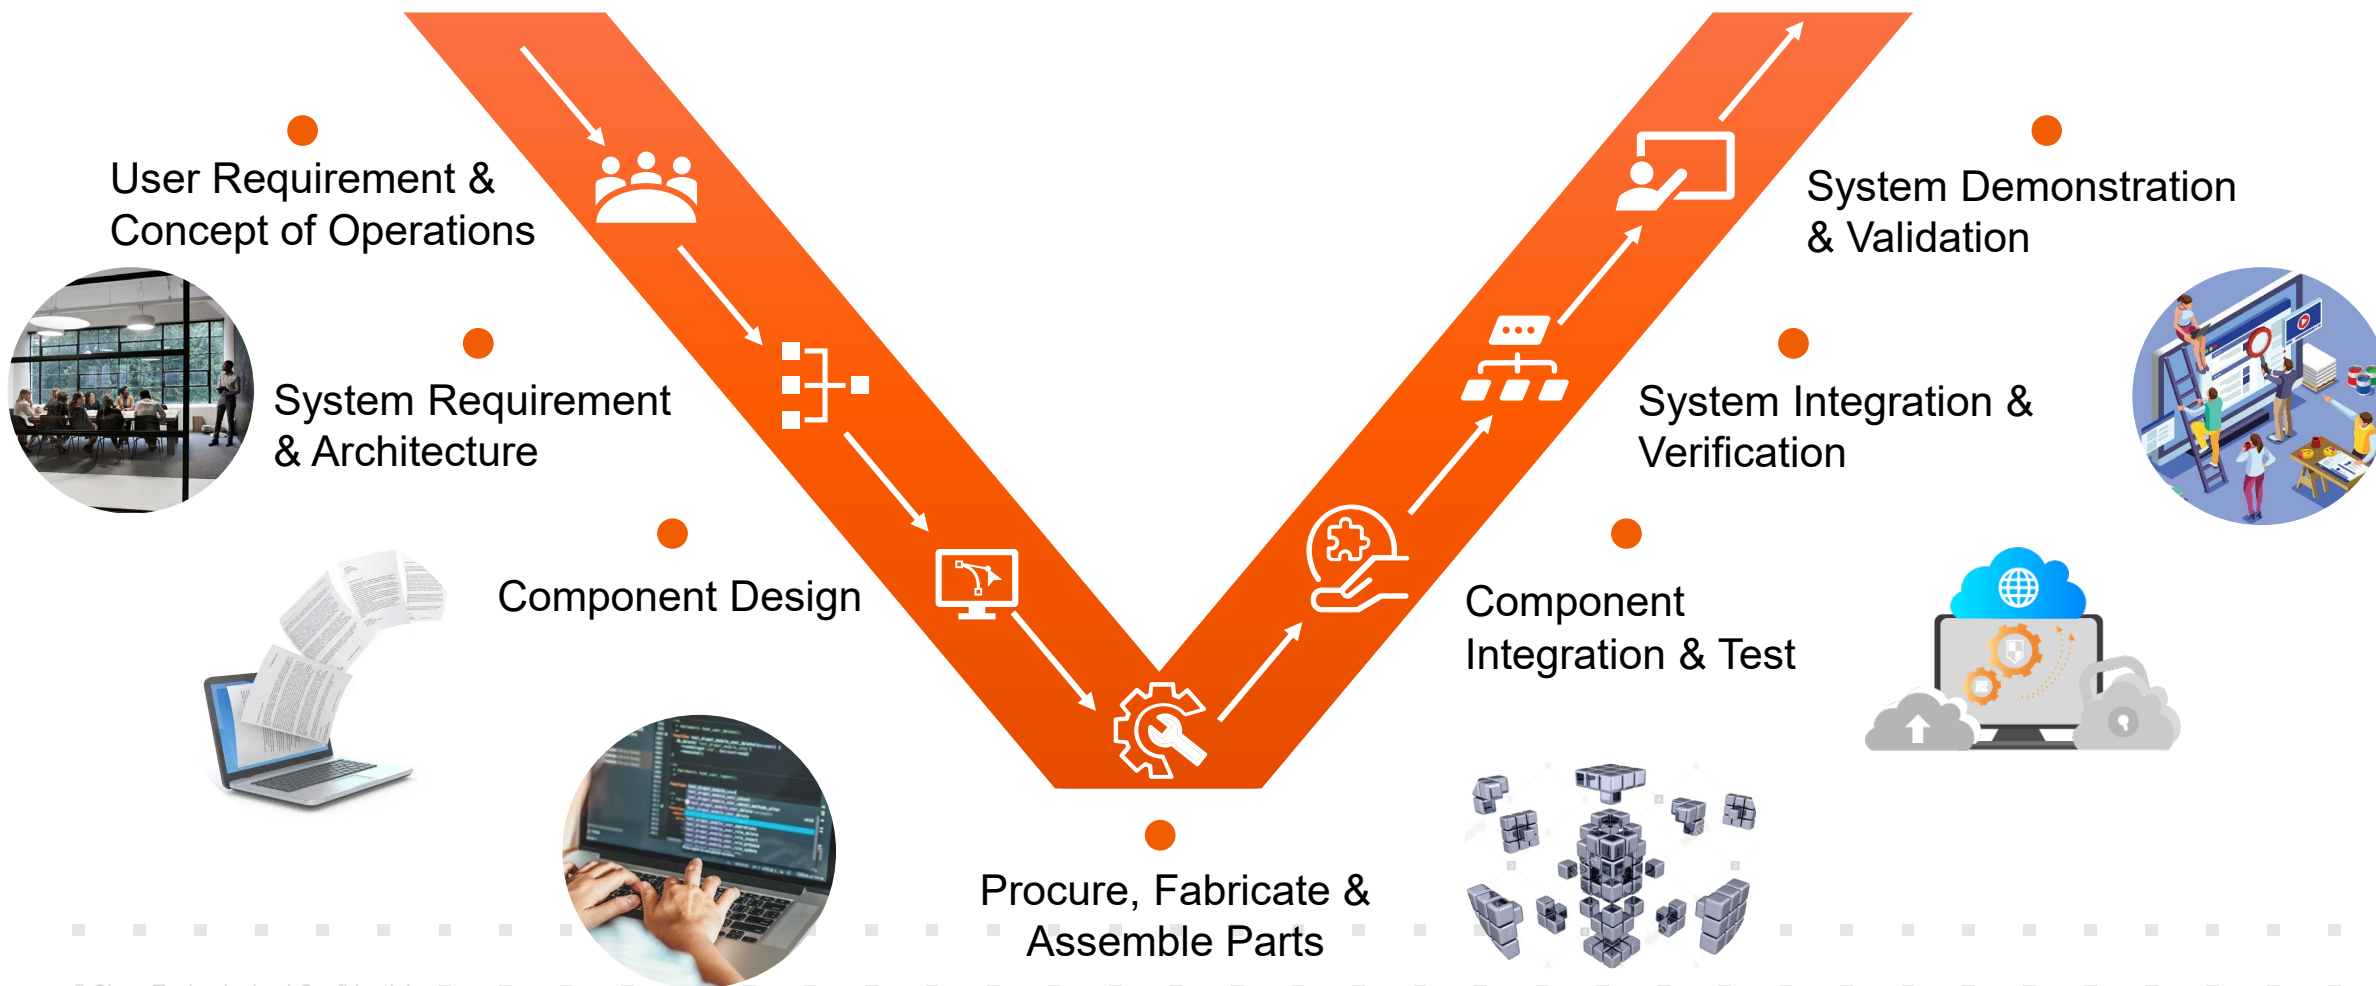

BACKGROUND

# Intelligent Motion Control Platform Background

- Created by **Sioux Technologies**
- Participating organizations: **31**
- Number of countries: **11**
- Internal name: **SAXCS**
- External name: **I-MECH**  
([www.i-mech.eu](http://www.i-mech.eu))

# V Model of Mechatronic System

# Iterative research & development to make V model more agile

Enhances  
Time to Market

Reduces Development  
Cost

# Virtual realizing the right arm of V-model

# Platform Architecture

## (Non-Real-Time Host PC)

- Python scripts, MATLAB, LabVIEW for quick tests GUI dev
- Use C / C++ / C# .NET to develop complicated and customized GUI

LAYER 3

### Host PC – User Interface (Non-Real-Time)

Python

MATLAB

LabVIEW

C/C++ C#  
.NET etc.

Ethernet

## (Target PC)

- Support Real-Time Operation System
- Model-Based Design
- Auto-Generated Code
- Hardware Abstraction
- Selectable between Hardware and Simulation

LAYER 2

### Target PC - Real-Time Operation System

Control Logic

Control Algorithm

System Identification

Monitoring & Diagnostics

Hardware Abstraction

Selectable between Hardware and Simulation

Hardware Interface

OR

Simulation Model

EtherCAT, PCIe, etc.

### System Hardware

Actuator System

ME System

Measurement System

LAYER 1

- Actuator System, Mechanical System, Measurement System.
- Interface: EtherCAT, PCIe, etc.
- Compatible to commercial components and tailored I/O

# Zoom in Layer 2

## (Hardware Abstraction)

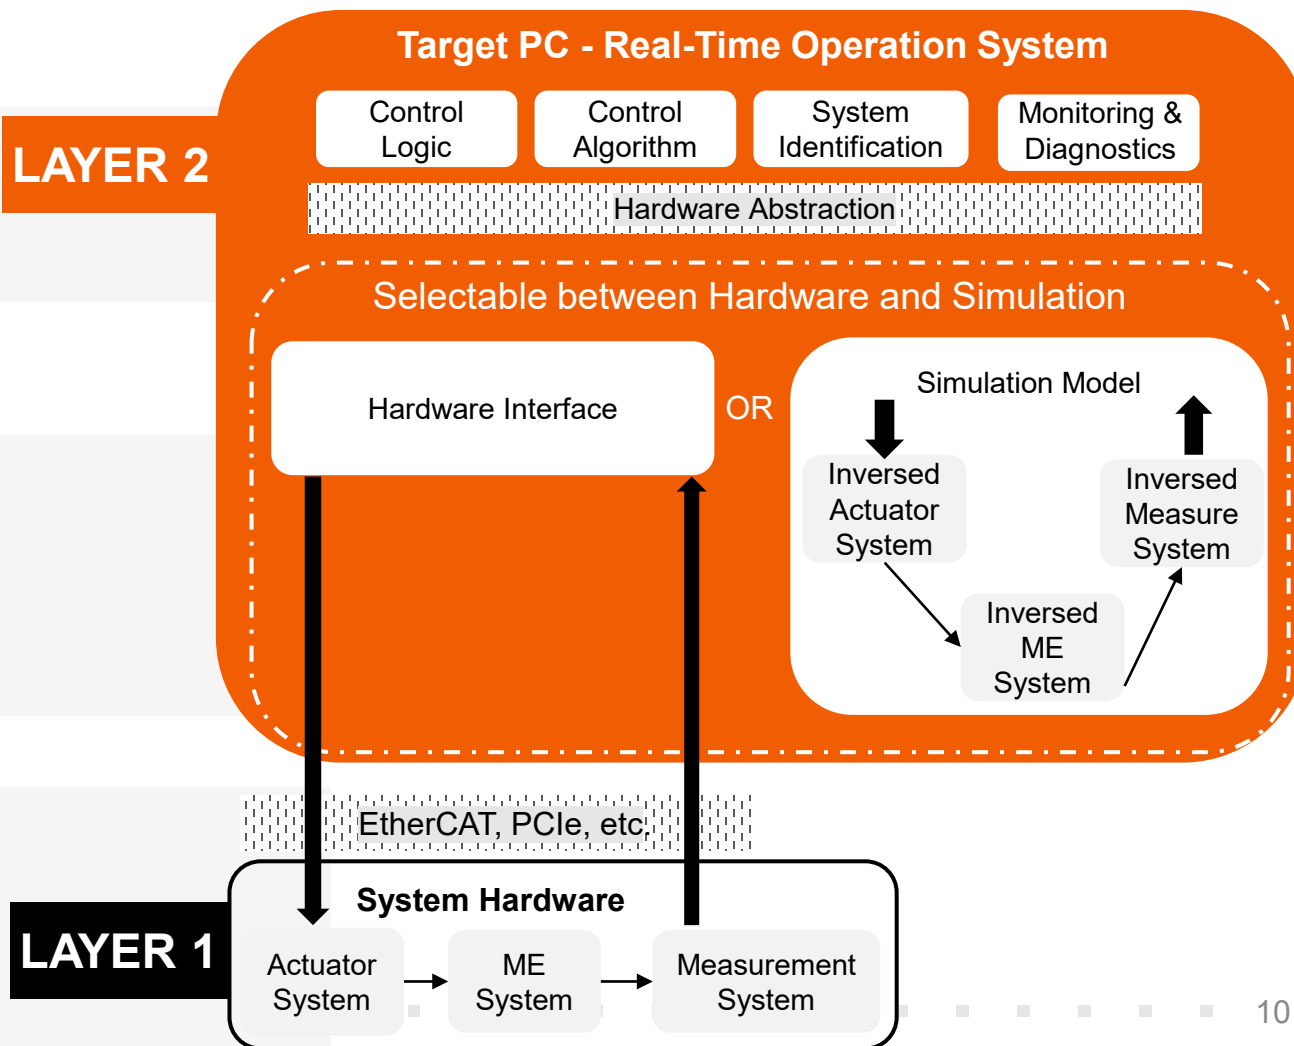

- Make the right split between embedded software designer and mechatronics designer

## (Simulation Model)

- Simulated real hardware as digital twin (Inversed hardware)
- Auto-Generation RTOS codes from model

## (Real Hardware)

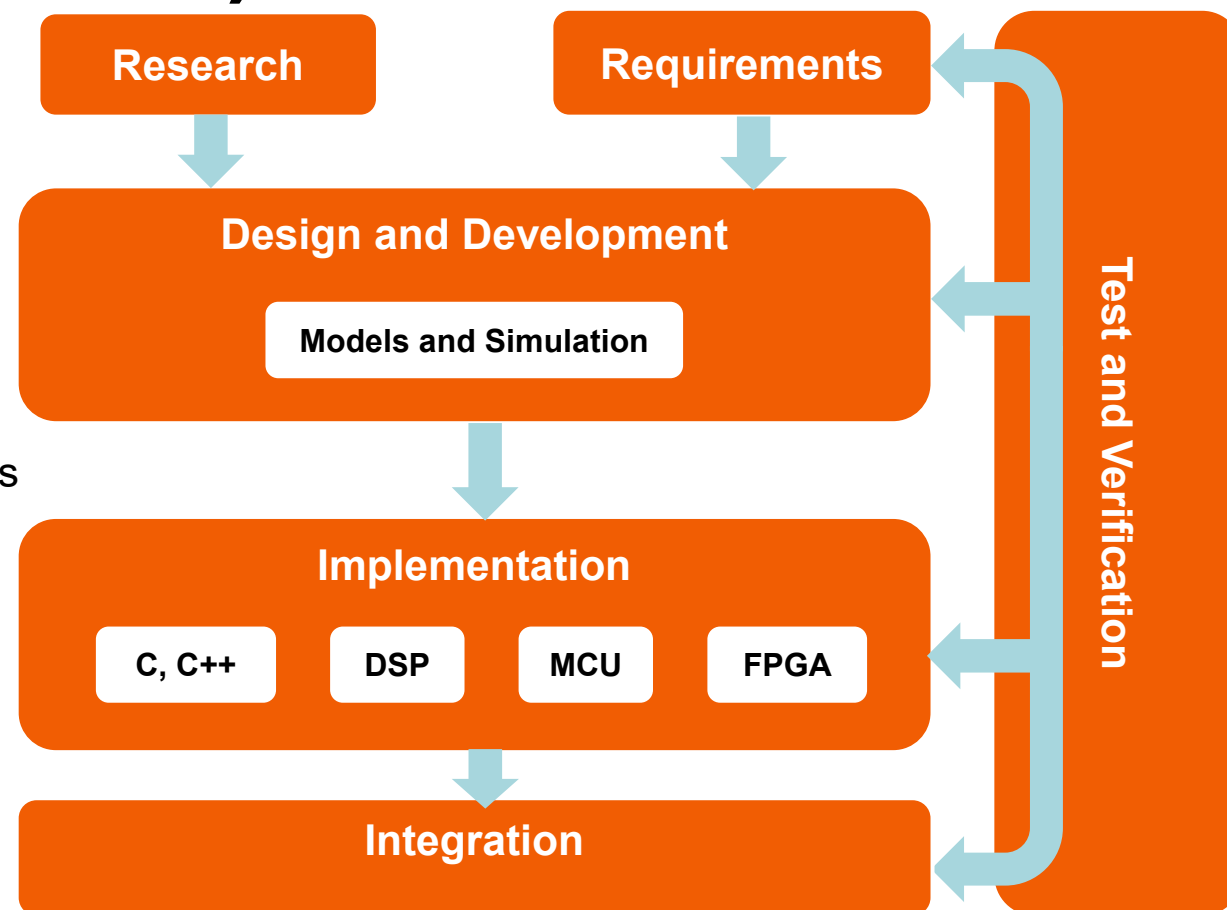

- Actuator System, Mechanical System, Measurement System
- compatible to commercial components and tailored I/O

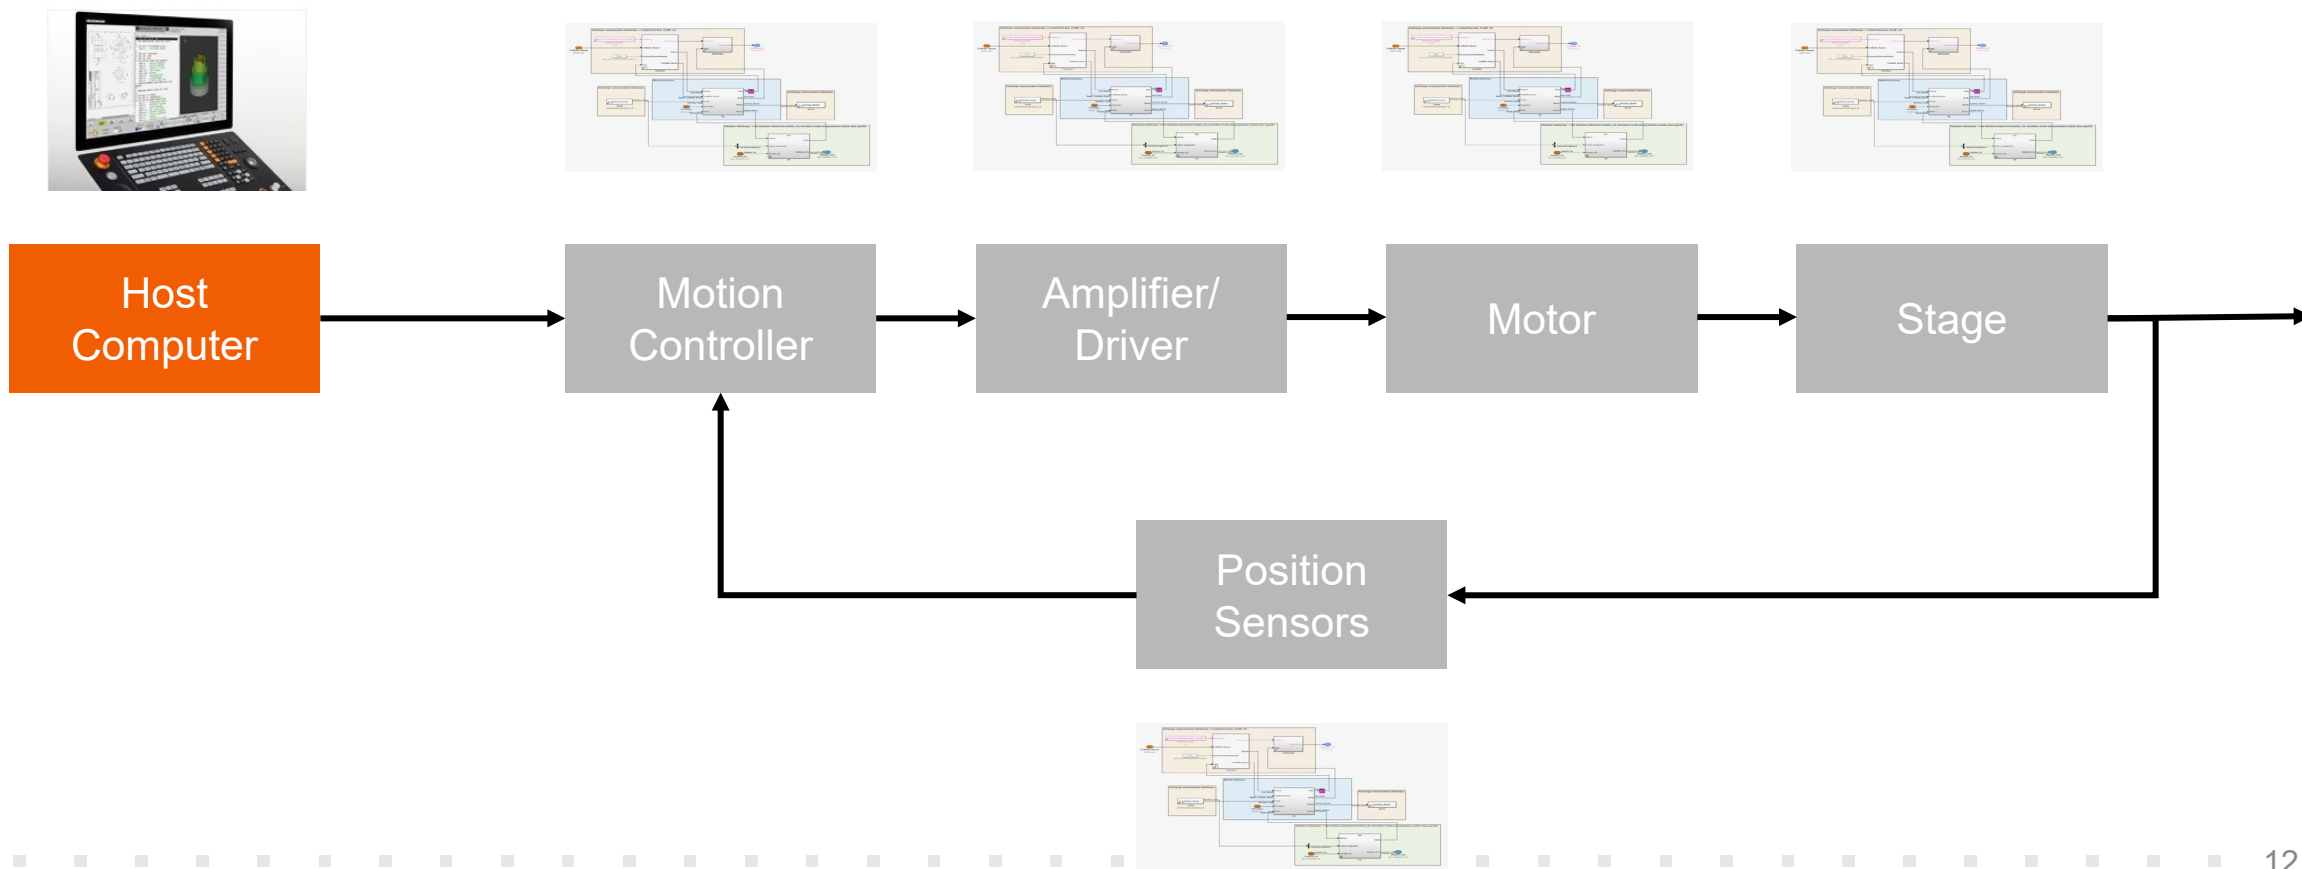

# Model Based Design (MBD)

## Overview

- Design and Development on Model
- Intuitive and easier to maintain
- Auto-generation from model to code
- Easy to communicate and understand across disciplines
- SIL (software-in-the-loop)
- PIL (processor-in-the-loop)
- HIL (hardware-in-the-loop)

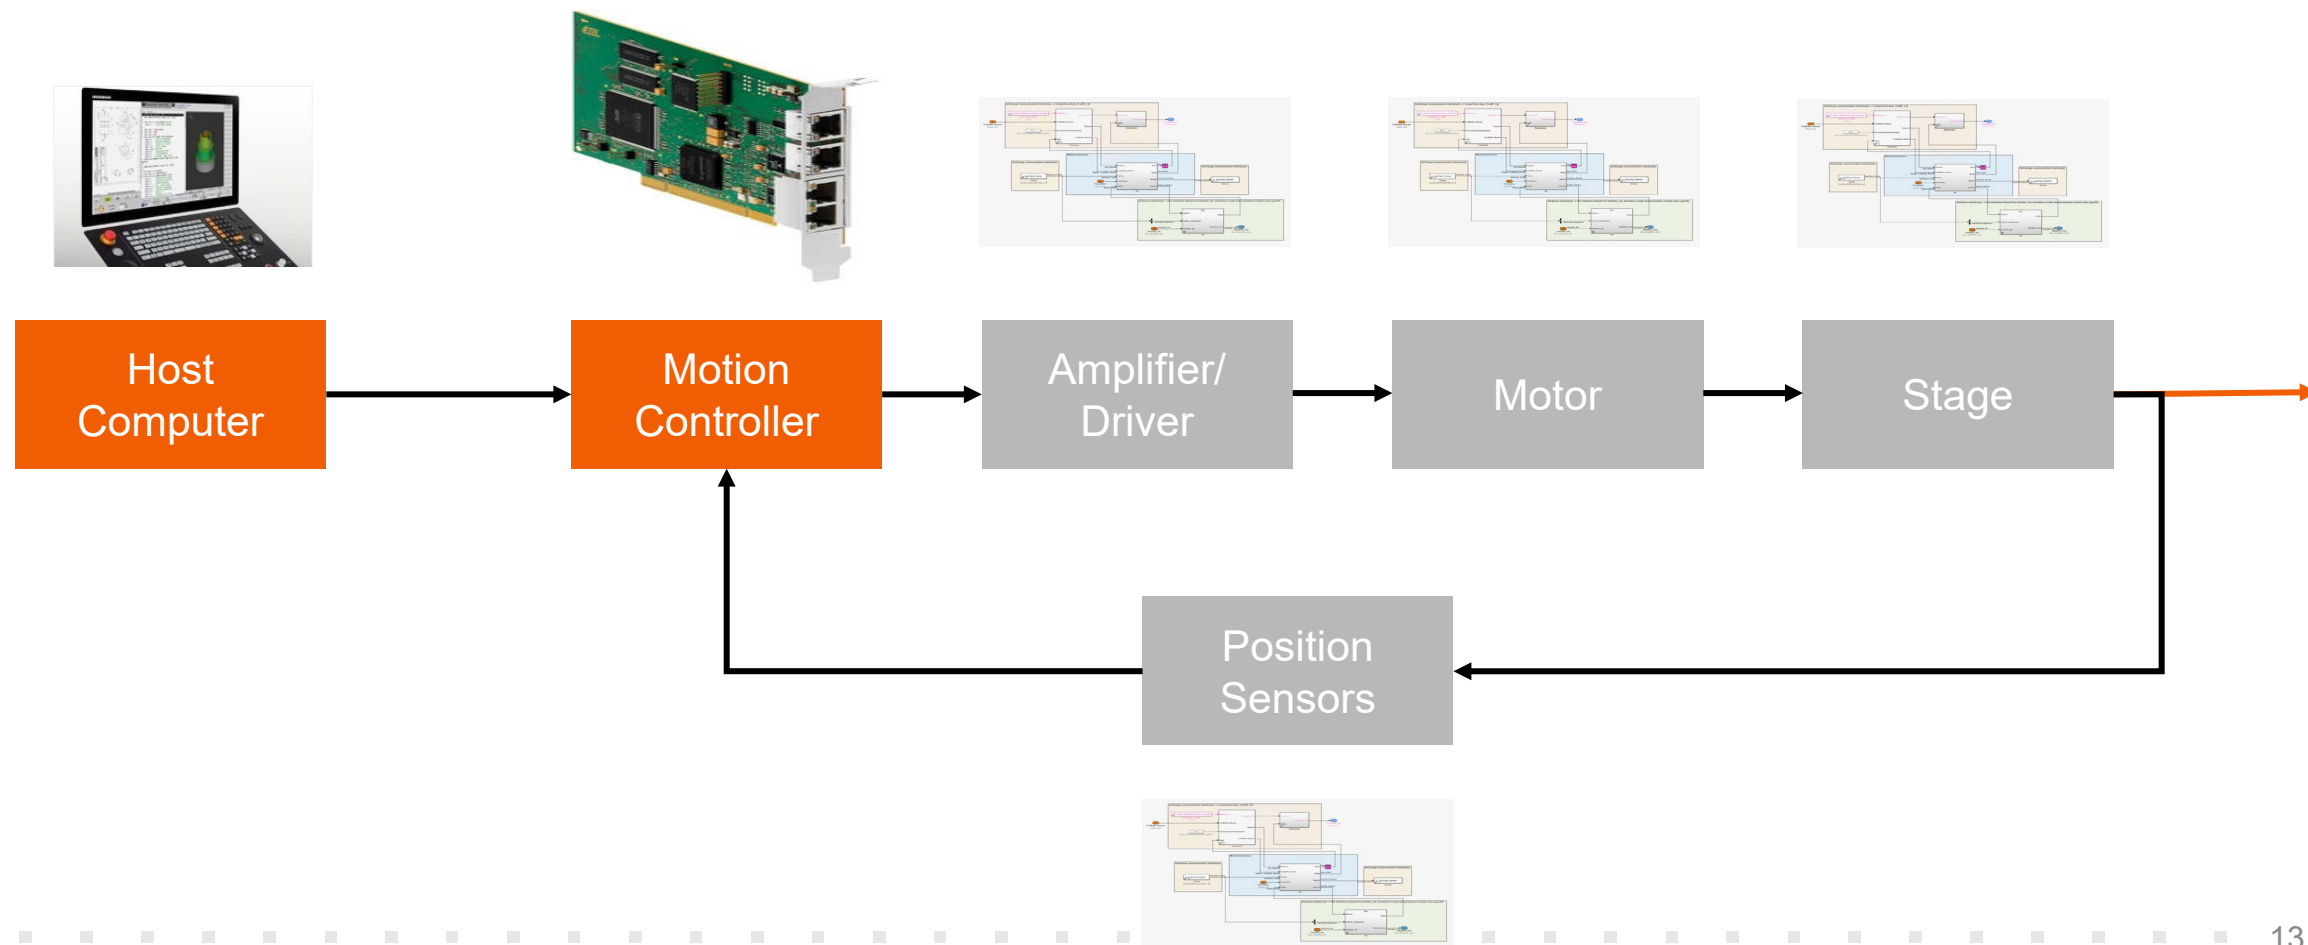

# MBD: Software-in-Loop

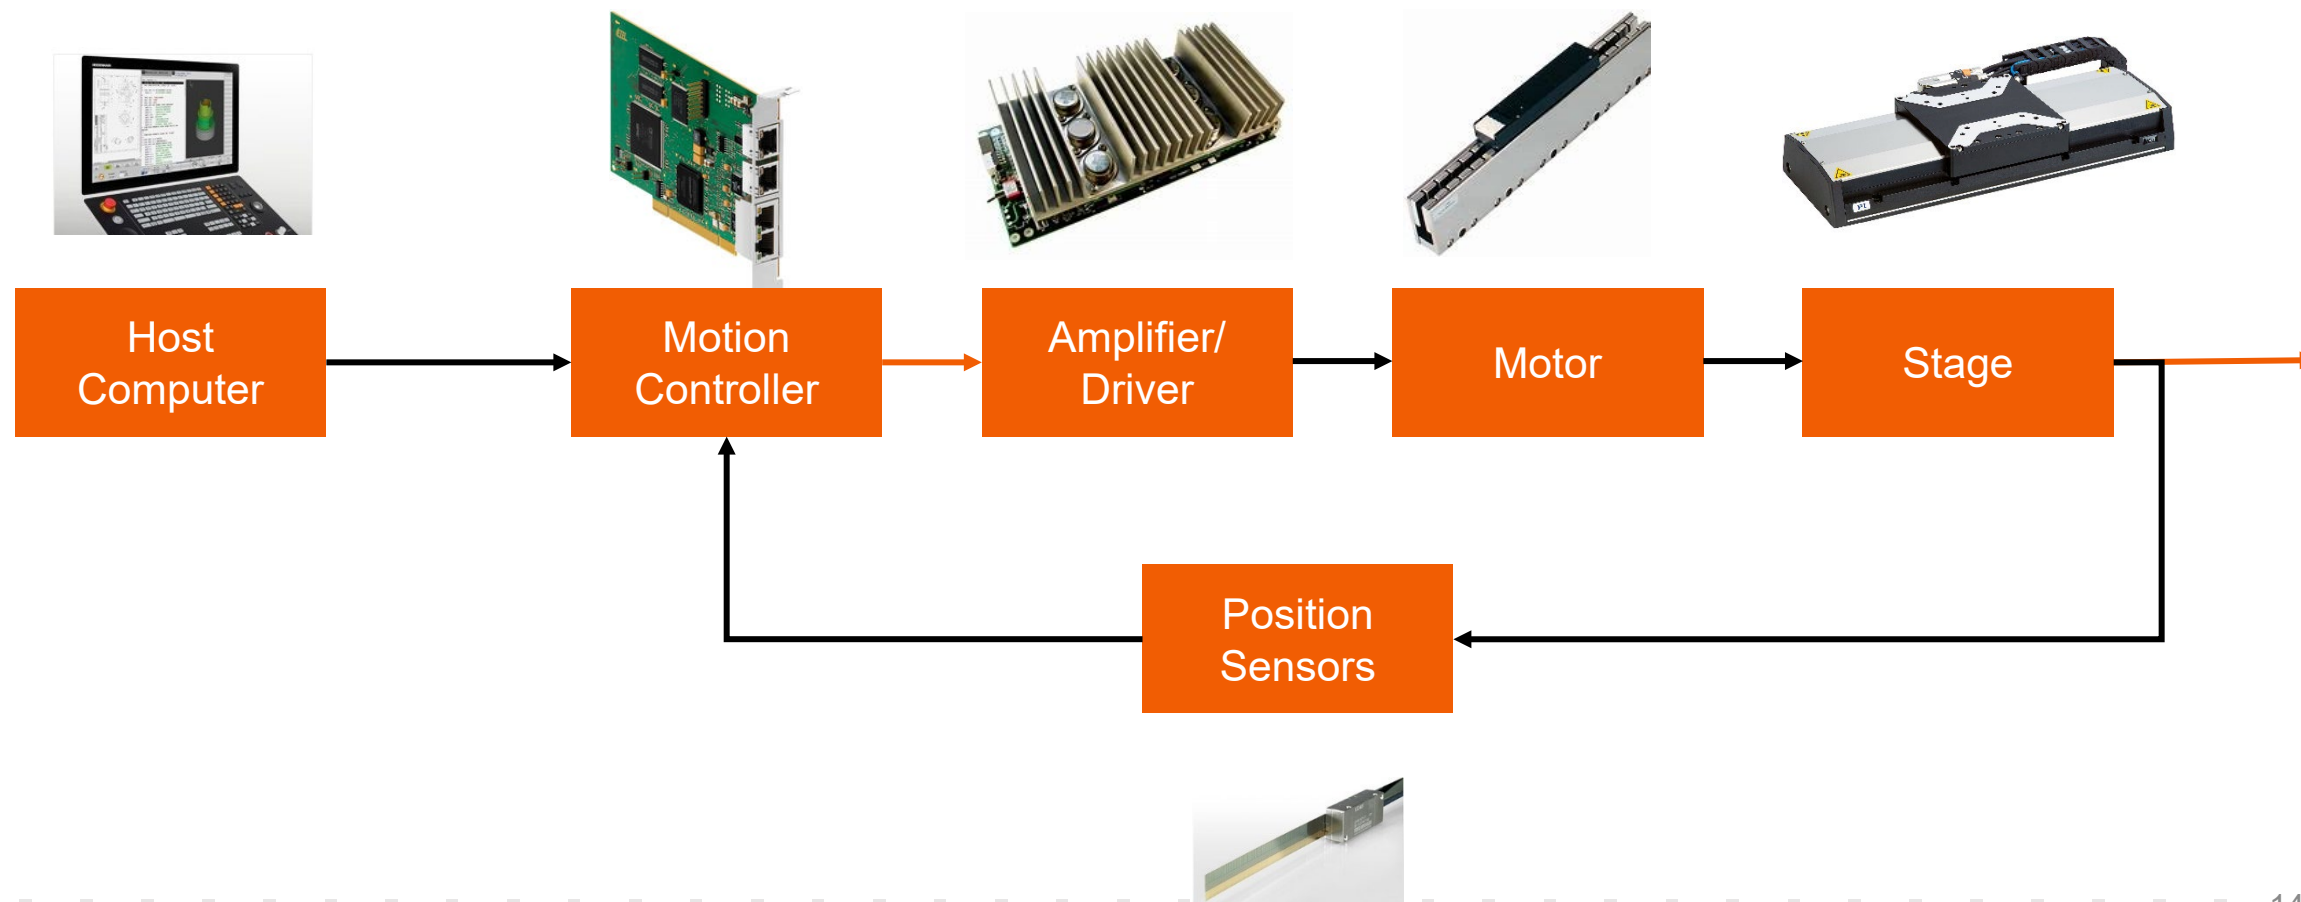

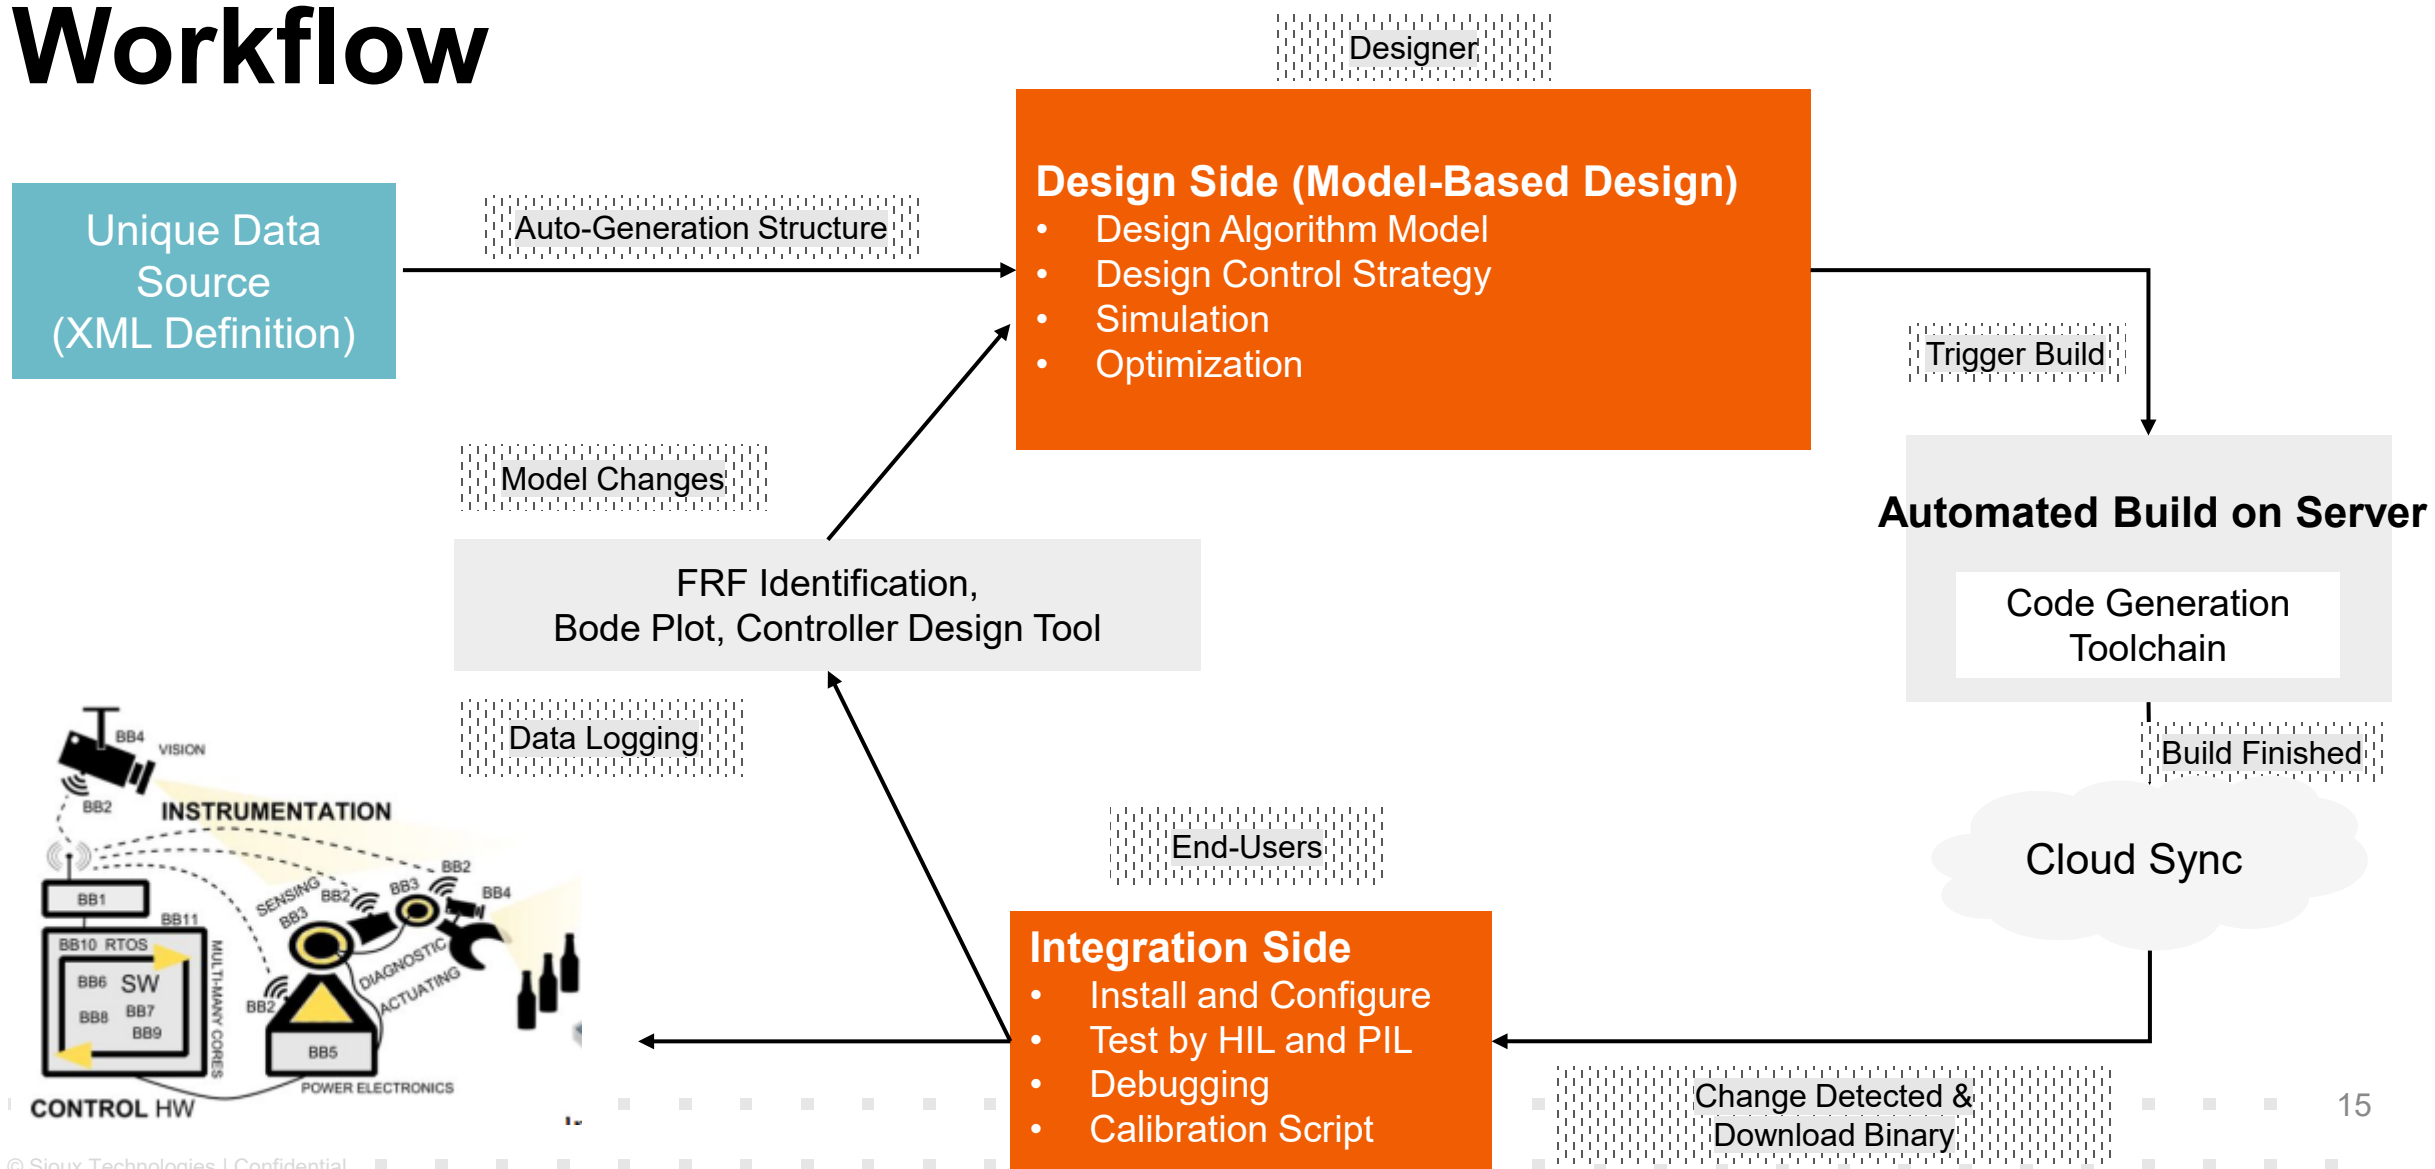

# MBD: Processor-in-Loop

# MBD: Hardware-in-Loop

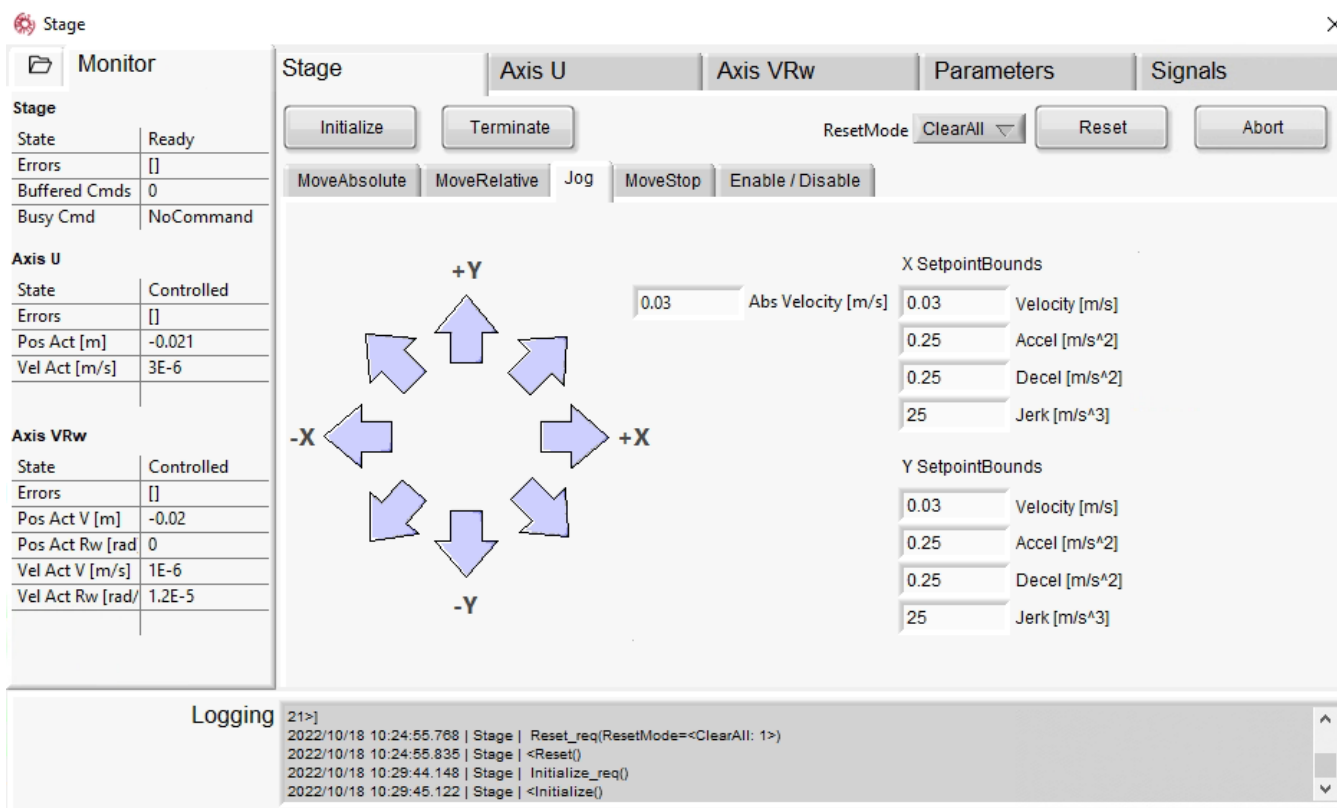

# Workflow

# GUI and Customized Programming

The screenshot shows the Stage GUI with the following components:

- Monitor Panel:**
  - Stage:** State: Ready, Errors: [], Buffered Cmds: 0, Busy Cmd: NoCommand
  - Axis U:** State: Controlled, Errors: [], Pos Act [m]: -0.021, Vel Act [m/s]: 3E-6
  - Axis VRw:** State: Controlled, Errors: [], Pos Act V [m]: -0.02, Pos Act Rw [rad]: 0, Vel Act V [m/s]: 1E-6, Vel Act Rw [rad/s]: 1.2E-5
- Control Panel:**
  - Buttons: Initialize, Terminate, MoveAbsolute, MoveRelative, Jog, MoveStop, Enable / Disable
  - ResetMode: ClearAll (dropdown), Reset, Abort
- Diagram:** A circular diagram with arrows pointing in the four cardinal directions: +Y (up), -Y (down), +X (right), and -X (left).
- Parameters:**
  - X SetpointBounds:** Abs Velocity [m/s]: 0.03, Velocity [m/s]: 0.03, Accel [m/s^2]: 0.25, Decel [m/s^2]: 0.25, Jerk [m/s^3]: 25
  - Y SetpointBounds:** Velocity [m/s]: 0.03, Accel [m/s^2]: 0.25, Decel [m/s^2]: 0.25, Jerk [m/s^3]: 25
- Logging:**

```

21>
2022/10/18 10:24:55.768 | Stage | Reset_req(ResetMode=<ClearAll: 1>)
2022/10/18 10:24:55.835 | Stage | <Reset()
2022/10/18 10:29:44.148 | Stage | Initialize_req()
2022/10/18 10:29:45.122 | Stage | <Initialize()

```

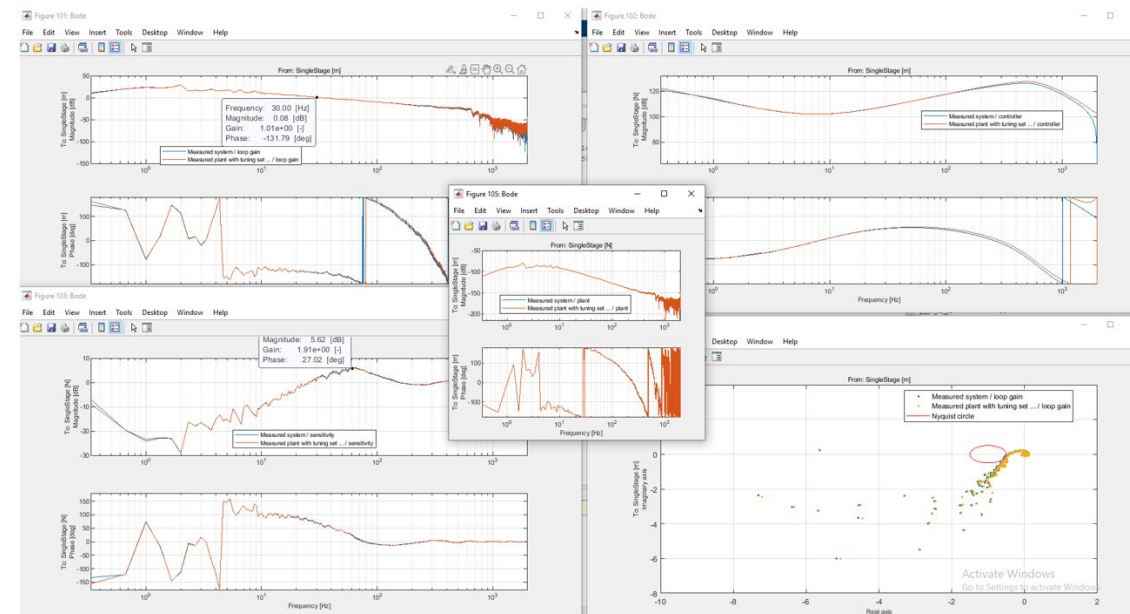

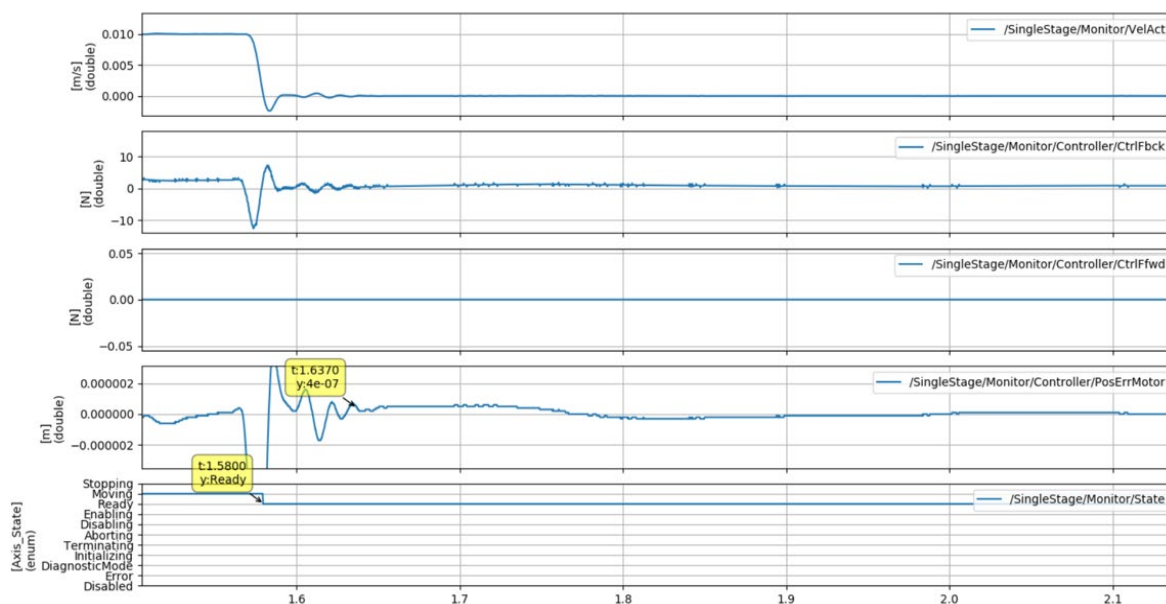

```

1 #! .._python.bat
2 # first line is a so called 'shebang' and is used to executed the python script direct from explorer, refer to _python.bat for more details.
3 """ Tutorial command handling """
4 import time
5 from scripttools import LogConfig
6 from saxscscontroller.slrt.gppid import *
7
8
9
10 def main():
11     LogConfig() # refer to logging_basic tutorial
12     # create the object, using the name as listed in the SystemDescription.xml
13     gppid1 = GPPID('GPPID1')
14     gppid2 = GPPID('GPPID2')
15
16     gppid1.Tuning.restore()
17     gppid1.Reset()
18     gppid2.Tuning.restore()
19     gppid2.Reset()
20
21     gppid1.Enable()
22     gppid2.Enable()
23
24     # Async commands demo starts here
25     #####
26
27     print('first move sequential')
28     gppid1.MoveRelative(Step=1, Velocity=1, Acceleration=10, Jerk=100)
29     gppid2.MoveRelative(Step=1, Velocity=1, Acceleration=10, Jerk=100)
30     time.sleep(1)
31     print('now move in parallel, start of movements (almost) at the same time')
32     # all slrt commands have a Command_req(arguments) / Command_wait(timeout) pair,
33     # the _req is used to initiate the command, without waiting for completion / exception
34     # the _wait checks if the reply of the corresponding command is received, if not it waits for the reply.
35     # Note: command exception and/or module error remain unnoticed,
36     # ( i.e they remain in the communication buffer) until the _wait is called.
37
38     gppid1.MoveRelative_req(Step=1, Velocity=1, Acceleration=10, Jerk=100)
39     gppid2.MoveRelative_req(Step=1, Velocity=1, Acceleration=10, Jerk=100)
40     gppid1.MoveRelative_wait()
41     gppid2.MoveRelative_wait()
42     # also refer to RTScheduler example for real-time synchronisation of commands
43     gppid1.Disable()
44     gppid2.Disable()
45     print(' done')

```

# Monitoring & System Identification

- Monitor and record any signals and parameters for time domain analysis
- Analysis system frequency response function for optimizing system performance

# Ultra Precise Scalable System (UPSS)

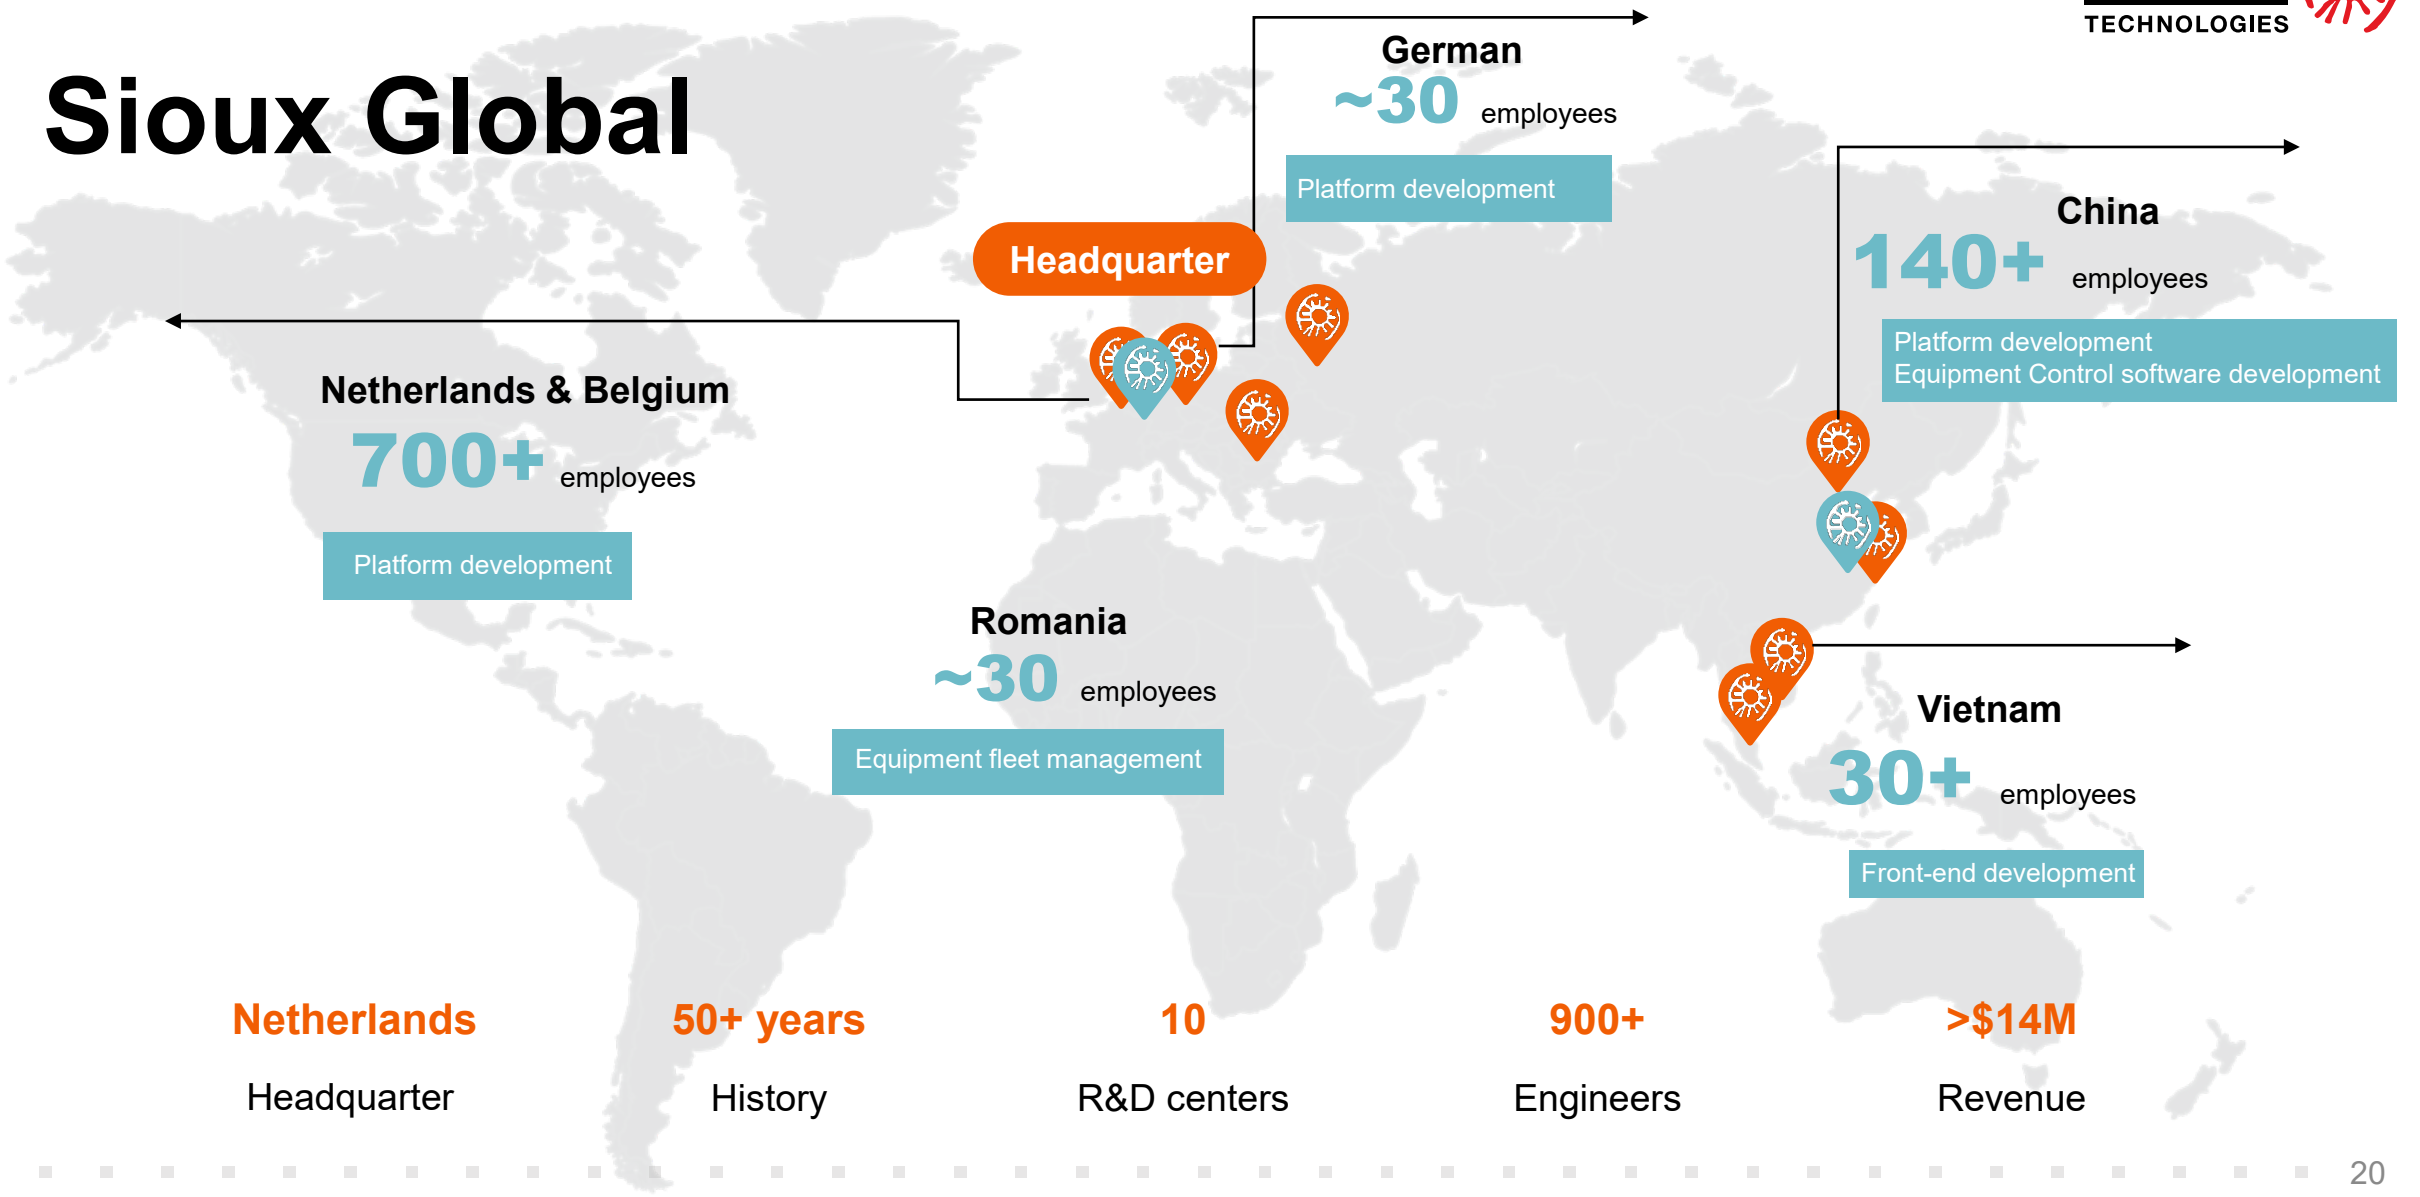

- Build with Intelligent Motion Control Platform
- XY: Up to 50nm (XY) accuracy
- Rz: 0.2urad resolution
- Customizable Active Isolator, Force Cancellation and Levelling

# Sioux Global

# Semiconductor application

## Front end

- Lithography
- Maskless imaging
- CVD,PVD
- Ion implant
- Etch
- Annealing

## Back end

- Wafer inspection
- Laser dicing
- Wire bonding
- Advanced packaging
- SMT

## Solar

- PECVD
- ALD

# Capability for Semiconductor Equipment development

## Mechatronics

- System design
- Fine mechanics design
- Dynamics modelling and analysis
- Electronics & Electrical design
- Realtime control system design

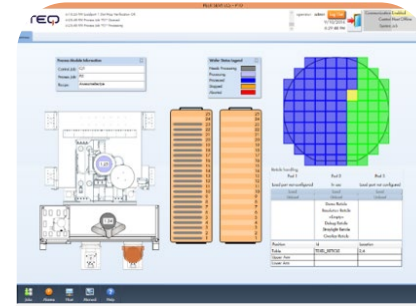

## Photonics

- Precise metrology and inspection
- Machine vision
- Optical modelling
- Application of laser and sensor

## Mathware

- AI and image processing
- Machine learning
- Thermo and fluids modelling
- Big data modelling and analysis

## Software

- Software engineering
- Equipment control software
- Cloud platform
- Cyber security
- Localization and internationalization

## UX

- Product definition
- Value proposition
- User experience
- HMI
- Data visualization
- Industry digitalization
